Functions

2

- Let A and B be nonempty sets.
- A *function* f from A to B , denoted $f: A \rightarrow B$ is an assignment of each element of A to exactly one element of B .
- We write $f(a) = b$ if b is the unique element of B assigned by the function f to the element a of A .
- Functions are sometimes called *mappings* or *transformations*.

Functions

3

- A function $f: A \rightarrow B$ can also be defined as a subset of $A \times B$ (a relation). This subset is restricted to be a relation where no two elements of the relation have the same first element.
- Specifically, a function f from A to B contains one, and only one ordered pair (a, b) for every element $a \in A$.

$$\forall x [x \in A \rightarrow \exists y [y \in B \wedge (x, y) \in f]]$$

$$\forall x, y_1, y_2 [(x, y_1) \in f \wedge (x, y_2) \in f \rightarrow y_1 = y_2]$$

Functions

4

Given a function $f: A \rightarrow B$:

- We say f maps A to B or
 f is a *mapping* from A to B .
- A is called the *domain* of f .
- B is called the *codomain* of f .
- If $f(a) = b$,
 - then b is called the *image* of a under f .
 - a is called the *preimage* of b .

Questions

5

$f(a) = ?$ z

The image of d is ? z

The domain of f is ? A

The codomain of f is ? B

The preimage of y is ? b

Question on Functions and Sets

- If $f : A \rightarrow B$ and S is a subset of A , then

$$f(S) = \{f(s) | s \in S\}$$

$f\{a,b,c\}$ is ? $\{y,z\}$

$f\{c,d\}$ is ? $\{z\}$

Injective

7

Definition: A function f is said to be *one-to-one*, or *injective*, iff $f(a) = f(b)$ implies that $a = b$ for all a and b in the domain of f . A function is said to be an *injection* if it is one-to-one.

Surjections

8

A function $f: A \rightarrow B$ is called *onto* or *surjective* iff for every element $b \in B$ there is an element $a \in A$ such that $f(a) = b$.

A function f is called a *surjection* if it is **onto**.

Example

Example 1: for $f : \{a,b,c,d\} \rightarrow \{1,2,3\}$, $f(a) = 3$, $f(b) = 2$, $f(c) = 1$, and $f(d) = 3$. Is f an onto function?

Solution: Yes, f is onto since all three elements of the codomain are images of elements in the domain.

Example 2: Is the function $f(x) = x^2$ from the set of integers onto?

Solution: No, f is not onto since there is no integer x with $x^2 = -1$, for example.

Bijections

10

A function f is a **one-to-one correspondence**, or a *bijection*, if it is both one-to-one and onto (surjective and injective).

Inverse Functions

11

Definition: Let f be a bijection from A to B . Then the *inverse* of f , denoted, is the function from B to A defined as

No inverse exists unless f is a bijection. Why?

$$f^{-1}(y) = x \text{ iff } f(x) = y$$

Inverse Functions

12

Questions

13

Example 2: Let $f: \mathbf{Z} \rightarrow \mathbf{Z}$ be such that $f(x) = x + 1$. Is f invertible, and if so, what is its inverse?

Solution: The function f is invertible because it is a one-to-one correspondence. The inverse function f^{-1} reverses the correspondence so $f^{-1}(y) = y - 1$.

Example 3: Let $f: \mathbf{R} \rightarrow \mathbf{R}$ be such that $f(x) = x^2$. Is f invertible, and if so, what is its inverse?

Solution: The function f is not invertible because it is not one-to-one.

Composition

14

- **Definition:** Let $f: B \rightarrow C, g: A \rightarrow B$. The *composition of f with g* , denoted $f \circ g$ is the function from A to C defined by $f \circ g(x) = f(g(x))$

Composition

Composition

16

Example 1: If $f(x) = x^2$ and $g(x) = 2x + 1$, then

and $f(g(x)) = (2x + 1)^2$

$$g(f(x)) = 2x^2 + 1$$

Composition Questions

17

Example 2: Let g be a function from $\{a,b,c\}$ to itself s.t.
 $g(a) = b$, $g(b) = c$, and $g(c) = a$.

Let f be a function from $\{a,b,c\}$ to $\{1,2,3\}$ s.t.
 $f(a) = 3$, $f(b) = 2$, and $f(c) = 1$.

What is the composition of f and g , and what is the composition of g and f .

Solution: The composition $f \circ g$ is defined by

$$f \circ g (a) = f(g(a)) = f(b) = 2.$$

$$f \circ g (b) = f(g(b)) = f(c) = 1.$$

$$f \circ g (c) = f(g(c)) = f(a) = 3.$$

Note that $g \circ f$ is not defined, because the range of f is not a subset of the domain of g .

Graphs of Functions

18

- Let f be a function from the set A to the set B . The *graph* of the function f is the set of ordered pairs $\{(a,b) \mid a \in A \text{ and } f(a) = b\}$.

Graph of $f(n) = 2n + 1$
from \mathbb{Z} to \mathbb{Z}

Graph of $f(x) = x^2$
from \mathbb{Z} to \mathbb{Z}

Partial Functions

A *partial function* f from a set A to a set B , denoted $f: A \dashrightarrow B$ is an assignment to each element a in a subset of A on a unique element b in B .

- The subset of A is called the *domain of definition* of f
- f is *undefined* for elements in A that are not in the domain of definition of f .
- When the domain of definition of f equals A , we say that f is a *total function*.

Example: $f: \mathbf{N} \rightarrow \mathbf{R}$ where $f(n) = \sqrt{n}$ is a partial function from \mathbf{Z} to \mathbf{R} where the domain of definition is the set of nonnegative integers. Note that f is undefined for negative integers.
