Discrete Mathematics

Recursion

Shin Hong

Recursively Defined Functions

Example: Suppose *f* is defined by:

$$f(0) = 3,$$

 $f(n + 1) = 2f(n) + 3$

Find f(1), f(2), f(3), f(4)

Solution:

- $f(1) = 2f(0) + 3 = 2 \cdot 3 + 3 = 9$
- f(2) = 2f(1) + 3 = 2.9 + 3 = 21
- $f(3) = 2f(2) + 3 = 2 \cdot 21 + 3 = 45$
- f(4) = 2f(3) + 3 = 2.45 + 3 = 93

Example: Give a recursive definition of the factorial function n!:

Solution:

$$f(0) = 1$$

 $f(n + 1) = (n + 1) \cdot f(n)$

Recursively Defined Functions

Example: Give a recursive definition of:

$$\sum_{k=0}^{n} a_k.$$

Solution:

The first part of the definition is $\sum_{k=0}^{0} a_k = a_0.$

The second part is
$$\sum_{k=0}^{n+1} a_k = \left(\sum_{k=0}^n a_k\right) + a_{n+1}$$
.

Fibonacci Numbers

Fibonacci (1170- 1250)

Example: The Fibonacci numbers are defined as follows:

$$f_0 = 0$$

 $f_1 = 1$
 $f_n = f_{n-1} + f_{n-2}$

Find f_2 , f_3 , f_4 , f_5 .

•
$$f_2 = f_1 + f_0 = 1 + 0 = 1$$

•
$$f_3 = f_2 + f_1 = 1 + 1 = 2$$

•
$$f_4 = f_3 + f_2 = 2 + 1 = 3$$

•
$$f_5 = f_4 + f_3 = 3 + 2 = 5$$

Recursion (Chapter 5)

Fibonacci Numbers

- **Example** Show that whenever $n \ge 3$, $f_n > \alpha^{n-2}$, where $\alpha = (1 + \sqrt{5})/2$.
- **Solution**: Let P(n) be the statement $f_n > \alpha^{n-2}$.

Use strong induction to show that P(n) is true whenever $n \ge 3$.

- BASIS STEP: P(3) holds since $\alpha < 2 = f_3$ P(4) holds since $\alpha^2 = (3 + \sqrt{5})/2 < 3 = f_4$
- INDUCTIVE STEP: Assume that P(j) holds, i.e., $f_j > \alpha^{j-2}$ for all integers j with $3 \le j \le k$, where $k \ge 4$. Show that P(k+1) holds, i.e., $f_{k+1} > \alpha^{k-1}$.
 - Since $\alpha^2 = \alpha + 1$ (because α is a solution of $x^2 x 1 = 0$), $\alpha^{k-1} = \alpha^2 \cdot \alpha^{k-3} = (\alpha + 1) \cdot \alpha^{k-3} = \alpha \cdot \alpha^{k-3} + 1 \cdot \alpha^{k-3} = \alpha^{k-2} + \alpha^{k-3}$
 - By the inductive hypothesis, because $k \ge 4$ we have $f_{k-1} > \alpha^{k-3}$, $f_k > \alpha^{k-2}$.
 - Therefore, it follows that $f_{k+1} = f_k + f_{k-1} > \alpha^{k-2} + \alpha^{k-3} = \alpha^{k-1}.$
 - Hence, P(k + 1) is true.

Recursion (Chapter 5)

Recursively Defined Sets and Structures

Recursive definitions of sets have two parts:

- The basis step specifies an initial collection of elements.
- The recursive step gives the rules for forming new elements in the set from those already known to be in the set.
- Sometimes the recursive definition has an exclusion rule, which specifies that the set contains nothing other than those elements specified in the basis step and generated by applications of the rules in the recursive step.
- We will always assume that the exclusion rule holds, even if it is not explicitly mentioned.
- We will later develop a form of induction, called *structural induction*, to prove results about recursively defined sets.

Recursion (Chapter 5)

Recursively Defined Sets and Structures

Example: The natural numbers **N**.

BASIS STEP: $0 \in \mathbb{N}$.

RECURSIVE STEP: If *n* is in **N**, then n + 1 is in **N**.

• Initially 0 is in S, then 0 + 1 = 1, then 1 + 1 = 2, etc.

Example: Subset of Integers S:

BASIS STEP: $3 \in S$.

RECURSIVE STEP: If $x \in S$ and $y \in S$, then x + y is in S.

• Initially 3 is in S, then 3 + 3 = 6, then 3 + 6 = 9, etc.

Recursion (Chapter 5)

Strings

- **Definition**: The set Σ^* of strings over the alphabet Σ :
 - BASIS STEP: $\lambda \in \Sigma^*$ (λ is the empty string)
 - RECURSIVE STEP: If w is in Σ^* and x is in Σ , then $wx \in \Sigma^*$
- **Example**: If $\Sigma = \{0,1\}$, the strings in in Σ^* are the set of all bit strings, $\lambda,0,1,00,01,10,11$, etc.
- **Example**: If $\Sigma = \{a,b\}$, show that *aab* is in Σ^* .
 - Since $\lambda \in \Sigma^*$ and $a \in \Sigma$, $a \in \Sigma^*$
 - Since $a \in \Sigma^*$ and $a \in \Sigma$, $aa \in \Sigma^*$
 - Since $aa \in \Sigma^*$ and $b \in \Sigma$, $aab \in \Sigma^*$

Recursion (Chapter 5)

Length of a String

- **Example**: Give a recursive definition of l(w), the length of the string w.
- **Solution**: The length of a string can be recursively defined by: $I(\lambda) = 0$; I(wx) = I(w) + 1 if $w \in \Sigma^*$ and $x \in \Sigma$.

Recursion (Chapter 5)

Balanced Parentheses

Example: Give a recursive definition of the set of balanced parentheses *P*.

Solution:

BASIS STEP: $() \in P$

RECURSIVE STEP:

- $-(w) \in P$ for $w \in P$
- $w w' \in P$ for $w \in P$ and $w' \in P$
- Show that (() ()) is in *P*.
- Why is))(() not in *P*?

Recursion (Chapter 5)

String Concatenation

- **Definition**: Two strings can be combined via the operation of concatenation. Let Σ be a set of symbols and Σ^* be the set of strings formed from the symbols in Σ . We can define the concatenation of two strings, denoted by \cdot , recursively as follows.
 - BASIS STEP: If $w \in \Sigma^*$, then $w \cdot \lambda = w$.
 - RECURSIVE STEP: If $w_1 \in \Sigma^*$ and $w_2 \in \Sigma^*$ and $x \in \Sigma$, then $w \cdot (w_2 x) = (w_1 \cdot w_2)x$.
- Often $w_1 \cdot w_2$ is written as $w_1 w_2$.
- If $w_1 = abra$ and $w_2 = cadabra$, the concatenation $w_1 w_2 = abracadabra$.

Recursion (Chapter 5)

Well-Formed Formulae in Propositional Logic

- **Definition**: The set of well-formed formulae in propositional logic involving **T**, **F**, propositional variables, and operators from the set $\{\neg, \land, \lor, \rightarrow, \leftrightarrow\}$
 - BASIS STEP: **T**,**F**, and *s*, where *s* is a propositional variable, are well-formed formulae.
 - RECURSIVE STEP: If E and F are well formed formulae, $(\neg E)$, $(E \land F)$, $(E \lor F)$, $(E \lor F)$, $(E \leftrightarrow F)$, are well-formed formulae.

Examples: $((p \lor q) \to (q \land F))$ is a well-formed formula. $pq \land$ is not a well formed formula.
